We are currently looking for master and bachelor students to write their thesis within the LegumeGAP project (Increasing productivity and sustainability of European plant protein production by closing the grain legume yield gap) under the supervision of Dr. Richard A. Omari and Prof. Sonoko D. Bellingrath-Kimura at our location in Müncheberg.

The project is currently ongoing and below are some potential topics in the coming growing season:

i) Evaluation of the performance of indigenous rhizobia isolates on soybean growth in the field and greenhouse conditions

ii) assessing the efficacy of different rhizobia carrier/binding materials on nodulation and soybean growth in cool growing conditions

iii) Characterization of the spectral vegetative indices of different soybean cultivars under inoculated/non-inoculated conditions.
